The Ch(e)at Code

Agent Patterns for Copilot Chat

▲ ▲ ▼ ▼ ◀ ▶ ◀ ▶ B A START

ISSUE #006 • APRIL 27, 2026 • WEEKLY

Last issue, we covered the approval gate pattern. This issue, we show you the full agent that uses it. A pharma customer had 20 project managers running multiple meetings per day — and every single one required manual meeting minutes. Here's how Pete Puustinen turned that into a two-agent pipeline built in 2.5 days.

This issue's pattern: A meeting-to-knowledge pipeline that automatically captures transcripts, generates summaries, gates them through approval, and makes the entire history searchable for leadership.

🎮 AGENT SPOTLIGHT

The Meeting Scribe & Library Agents

Built by Pete Puustinen • Validated with Eggis Pharma (Budapest Hackathon)

The scenario: A pharmaceutical company in Budapest has 20 project managers running multiple product meetings daily. After each meeting, someone manually copies the Teams meeting minutes into a Word document, reviews it, fixes gaps, and saves it. Leadership wants to ask questions across all project meetings — but first, those minutes have to be created, verified, and stored somewhere searchable. Today, all of this is manual and inconsistent.

The solution: Two agents, one pipeline.

Agent 1: The Scribe. Connects to the meeting object, fetches the raw transcript via a custom connector, saves the transcript as an immutable backup to a SharePoint library, then generates structured meeting minutes as a Word document. The document is routed to the project owner for approval.

Agent 2: The Library. Once a summary is approved, a Power Automate flow copies it to Azure Blob Storage and indexes it in Azure AI Search. The

Library Agent queries this index, giving leadership a natural-language interface to ask questions across all project meetings.

Build time: 2.5 days at a customer hackathon in Budapest, with a train-the-trainer session the day before. This was the most complex scenario across 10–11 customers at the hackathon — and it shipped working.

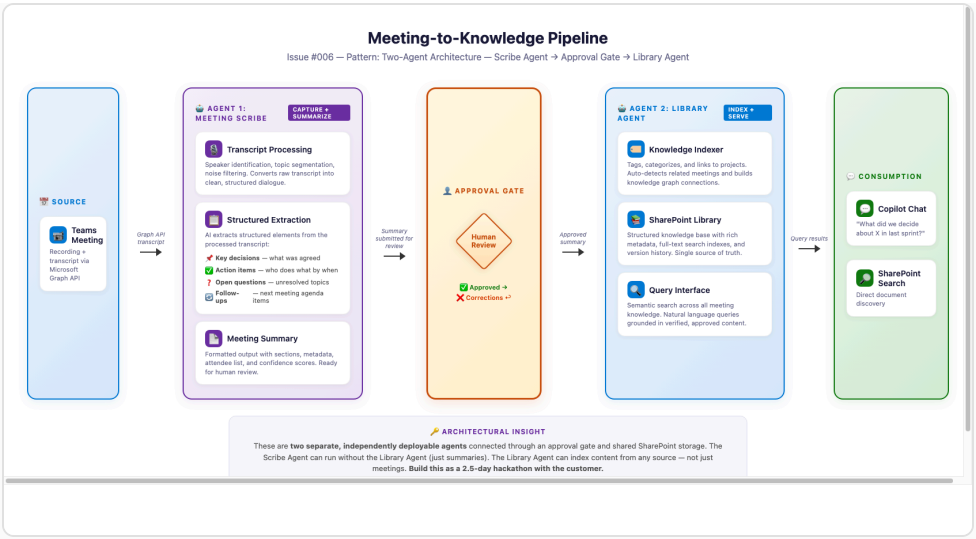
🧩 **PATTERN BREAKDOWN**

Meeting-to-Knowledge Pipeline

Copilot Studio + Power Automate + custom connector + Azure AI Search

END-TO-END FLOW

```
Meeting ends in Teams
  ↓
Scribe Agent triggered → decodes base64 meeting chat ID
  ↓
Custom connector → join URL → meeting ID → transcript ID
  ↓
Raw transcript (WebVTT) saved to SharePoint Library A
  ↓
AI generates meeting minutes → Word doc via Word Online
connector
  ↓
Doc saved to OneDrive → copied to SharePoint Library B
  ↓
Project owner reviews & approves (Issue #005 pattern)
  ↓
Approved doc → Azure Blob Storage → Azure AI Search index
  ↓
Library Agent answers leadership questions over indexed
docs
```



Full pipeline: Scribe Agent → approval gate → Library Agent with Azure AI Search

Key architecture decisions:

1. **Custom connector for transcript access.** The customer doesn't have Frontier enabled, so the team built a custom connector that calls Graph API to retrieve the raw transcript. This involves decoding a base64 meeting chat ID, resolving the join URL, fetching the meeting ID, then the transcript ID, then the raw WebVTT content. It's the most complex part of the build — but once it exists, it's reusable for any meeting intelligence scenario.

2. **Save-then-reference (token limit workaround).** Raw transcripts from one-hour meetings exceed AI prompt token limits. The team initially tried passing transcripts directly but hit limits. The fix: save the transcript to SharePoint, then pass a *link* to the file instead of the file contents. The sub-agent reads from the link.

3. **Two SharePoint libraries, not one.** Raw transcripts go to Library A (immutable, archival). Generated summaries go to Library B (editable, approvable). Clean separation means originals can never be accidentally modified.

4. **The agent is simple; the flow is complex.** As Pete put it: "The agent itself is actually simple. All the magic happens in the agent flow." The intelligence is in the Power Automate orchestration — the Copilot Studio agent is a thin interface on top. This is an important design insight: keep the conversational layer lean and push business logic into deterministic flows.

> **Looking ahead:** Pete has already tested MCP servers that can retrieve transcripts directly — which would eliminate the need for the custom connector entirely. Once Frontier moves to GA, this simplifies significantly. Build with the connector today; plan for MCP tomorrow.

⚠ **Known bug:** Text files (.txt, .vtt) currently can't be passed as attachments to AI prompts due to a parsing bug. Workaround: pass a link to the file instead. The sub-agent reads the content from the link. This is a known issue — flag it early with customers so it doesn't derail a demo.

🛠 **TRY THIS NOW**

Pitch the Hackathon, Not Just the Agent

1. **Find the meeting-heavy team.** Every customer has a group that runs 5–10+ recurring project meetings per week and drowns in documentation. Product management, R&D, clinical ops, and PMOs are the usual suspects. Ask: "How long after a meeting are searchable, approved minutes available to leadership?"
2. **Propose a 2–3 day hackathon.** This solution was built at a customer hackathon — not as a long consulting engagement. Position it as a joint build where the customer walks away with a working prototype and ownership of the solution. This shifts the dynamic from "vendor demo" to "we built this together."
3. **Day 0: Train-the-trainer.** Run a prep session the day before the hackathon. Brainstorm the customer's specific meeting types, what a good summary looks like for them, and who the approvers should be. This is where you tailor the pattern to their process.
4. **Layer on the patterns.** Start with the Scribe Agent (generation + approval gate from Issue #005). If time allows, add the Library Agent (Azure AI Search) on Day 2. The customer gets immediate value from the scribe alone — the library is the multiplier.

💡 **The line that opens doors:** "What if every meeting your team runs this week was automatically documented, approved by the project owner, and searchable by leadership by end of day — and we could build that together in two days?"

🏆 **WHERE THIS PATTERN LANDS**

- **Pharmaceuticals & life sciences** — product development meetings, clinical trial reviews, regulatory documentation
- **Professional services** — client engagement meetings, project status reviews, partner coordination
- **Manufacturing** — production planning, quality reviews, supplier coordination
- **Education** — faculty meetings, academic committee discussions, board records
- **Any organization** where leadership needs cross-project visibility without attending every meeting

Positioning tip: Lead with the PMO (Program Management Office) persona. They're drowning in meeting follow-ups and are often the internal champion for Teams adoption. They'll pull leadership into the conversation once they see the Library Agent in action.
